

### **Product-Range**

**Hydraulic Filtration for Highest Performance** 

purifying our planet

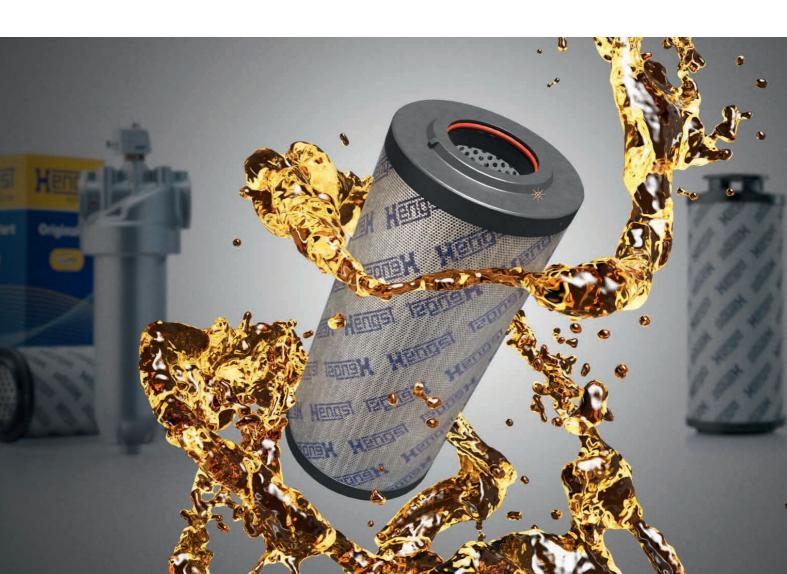

## Hengst Filtration Product-Range

We provide a complete product range of hightech filters and filter elements for the most stringent applications. For every application you will find the right solution for the filtration of hydraulic fluids, lubricating oils, industrial fluids and gases.

Our broad portfolio ensures optimal operating conditions throughout the entire life cycle, thus redu-cing the total cost of ownership. As with all products and solutions, we also consistently comply with international norms and standards. This opens up the technical advantages of our filter technology for all applications, regardless of the original equipment manufacturer. Our closeknit global sales and service network provides short communication channels and expert advice at all times.

# With Know-how and Experience

Established in 1958 | Family business for three generations 21 locations on 5 continents | 3.500 employees

The name Hengst is known throughout the world for people with passion, lean structures, innovative technologies and operational excellence. All of these qualities have made us a leading, internationally recognised development partner and series supplier of filtration technology for vehicle and engine manufacturers, as well as for industry and the consumer goods sector. With a network of 21 locations in Germany, Brazil, China, Denmark, India, Poland, Singapore, the United Arab Emirates, USA and Australia we are a reliable partner for manufacturers and customers worldwide.

Strategically positioned locations ensure optimal market and customer proximity and enable us to react quickly at any time and to deliver the latest filtration technology on short, environmentally friendly transport routes with pinpoint accuracy. Through the use of consistent quality standards, our customers can rely on top quality at all the development, production and sales locations.

#### The cyclone effect for improved efficiency:

With Cyclone-Effect, fluid flow enters filter housing on tangent to the element, rather than directly against it. Thus oil envelops the element surface and is distributed over the filter media surface in a downward spiral flowing pattern. This patent pending feature ensures heavy contamination particles are carried outward and away from the filter element preventing the pores from blocking prematurely. These heavier particles will accumulate on the inside and bottom of the filter bowl, depending on the actual fluid flow conditions, increasing the dirt holding capacity and extending the time between element replacements by  $7-10\,\%$ .

#### Filter elements with PURE POWER (PWR):

Filter elements with  $\underline{P}$ URE  $\underline{P}$ OWER (PWR) now absorb up to 50 % more particles, with a comparable retention rate and low differential pressure. All filter elements are equipped with an electrically conductive fleece as a standard feature, this reduces the risk of electrostatic charging and discharging in the filter.
